

ABSTRACT

A received telephone number is classified into group and stored by a simple operation, and is used as the telephone number when making a call.

It comprises a telephone number detector (2) for detecting an
5 incoming telephone number from a telephone line, an operation unit (13) for
specifying the group of the detected telephone number, a memory (11) for
storing the information of the specified group and the telephone number in
correspondence, and LED (15a - 15d, 19a - 19b) for displaying multiple
10 colors. In the incoming operation, the lamp color is changed to display
which group the received telephone number belongs to, and the call receiver
easily recognizes the call is from which specific group. Further, when
dialing by making use of the stored telephone number, the telephone
number is displayed and searched in each group.
